ABSTRACT

This Kids Count data book examines statewide trends in the well-being of Connecticut's children. The report first examines the extent of child poverty in Connecticut, as well as its causes and effects, and suggests some possible courses of action. Following demographic information, the bulk of the report provides a statistical portrait of Connecticut's children based on 14 indicators of well-being: (1) children living in poverty; (2) family setting; (3) children in families receiving welfare benefits; (4) children receiving free or reduced-price meals; (5) low birthweight; (6) infant mortality; (7) prenatal care; (8) births to teen mothers; (9) performance on Connecticut Mastery Test; (10) performance on Connecticut Academic Performance Test; (11) high school dropout rate; (12) juvenile violent crime arrests; (13) child abuse; and (14) teen deaths. Among the findings, the report indicates that increasing numbers of children are living in poverty; the number of children in families receiving welfare benefits has declined; the low birthweight rate has increased; and test performance has improved, as has the dropout rate. Percent of births to teen mothers has remained static. The final portion of the report presents the child well-being information organized by region rather than indicator. An explanation of terms and methodology concludes the report. (HTH)

CAHS

The Connecticut Association for Human Services (CAHS) is an independent nonprofit, research, public education and policy development organization committed to promoting the health and well-being of our state's residents—young and old alike. CAHS serves as a catalyst, working with diverse constituencies throughout the state to ensure the provision of human services that are of the highest quality, responsive to people's needs and cost-effective.

Founded in 1910 as the Conference on Charities and Corrections, the Association was reorganized in 1964 as CAHS. Our membership includes concerned citizens, religious leaders, corporations, labor leaders, human services professionals and organizations, educators, and policy makers. We welcome your membership and support.

Acknowledgments

First and foremost, I would like to thank the Annie E. Casey Foundation for the multi-year commitment it has made to supporting the development of this book and our entire KIDS 2000 initiative. In particular, thanks go to Doug Nelson, for his leadership, Betty King for her insight, and Jennifer Baratz and Bill O'Hare for their dedication to the KIDS COUNT mission.

Many people within the Connecticut Departments of Children and Families, Education, Public Health, Public Safety, and Social Services were incredibly helpful in their provision of data and technical advice. Special thanks go to them as well.

This book would not have been possible without the professional guidance and personal support of the staff at CAHS. They are the best group of people with whom one could ever hope to work. Their sense of humor, the depth of their caring for each other, and their commitment to making the world a better place is inspiring. Each of them has earned my undying admiration and gratitude. Extra special thanks go to Judy Demarest whose patience and skill with the design and layout for the 1998 book amaze me.

Overview of Contents

This book is divided into five sections:

The **Introduction** by CAHS's Executive Director, Paul Gionfriddo.

Increasing Child Poverty: What does it mean for Connecticut's future? This section examines the extent of child poverty in Connecticut, as well as its causes and effects, and suggests some possible courses of action.

The **Child Well-Being Indicators** section is made up of 15 important indicators of the well-being of children and two demographic measures. Each indicator is a separate table, comparing different cities and regions of the state. Regions with rates worse than the statewide rate are highlighted. Indexes to the towns and regions, and a map of these regions, are included at the beginning of this section.

In the **Regional Indicators** section the same child well-being information is presented, but it is organized by region instead of by indicator. Where possible, the rate for the region is shown as a percentage better or worse than the statewide rate. This section allows readers to see, at a glance, how well children are faring in their region of the state.

An explanation of the **Terms and Methodology** used in the indicators sections appears at the back of the book.

Introduction

Connecticut's Children: Increasingly Poor is the fifth in an annual series which documents the well-being of Connecticut's children. We wish we had better news to report, but we don't. This year, new data have come to light about Connecticut's failure to help our most vulnerable children: in the past decade we've seen a large increase in the poverty rate of children in Connecticut, especially our youngest.

The data show that no age group is more likely to live in poverty than children under age 6, with poverty rates more than twice as high as those for adults 18-64 years of age and the elderly. To have one-quarter of our youngest children living in poverty in the richest state in the nation is both astonishing and shameful.

The negative effects of childhood poverty are both immediate and long-lasting. Poor children are more likely than rich or middle-class children to experience material deprivation and poor health, die during childhood, score lower on standardized education tests, drop out of school, have out-of-wedlock births, experience violent crime, end up poor as adults, and suffer other undesirable outcomes. Child poverty rates provide important information about the percentage of children whose current life circumstances are hard and whose futures are potentially limited as a result of their family's low income.

The fact that this is happening here in Connecticut is especially troubling because the child poverty rates in other New England states have stabilized or improved. The difference seems to be that these other states have done a better job implementing anti-poverty programs such as income tax credits for families with children, subsidized child care, and housing assistance.

Despite falling unemployment and rising average weekly wages, many children in Connecticut are not faring well because families with young children are more likely to be unemployed and more likely to be employed at lower wages. To assure that economic good times reach all Connecticut children and their families, we need to look closely at where we fall short of meeting their basic needs and commit our state's full energy and resources to solving these problems.

Beyond its focus on poverty, this publication brings together data about many aspects of child well-being in order to paint a comprehensive picture of the status of children in Connecticut. It contains indicators that are readily available for each town in the state, easily understood, and collected annually. Unfortunately, many measures of child well-being, such as the number of children with inadequate child care, are not collected in our state, and therefore we cannot report on them.

Of course, many Connecticut children are born healthy, succeed in school, and become happy and productive adults. Most of Connecticut's children are surviving, but one in five lives in poverty. We want more for our kids than just survival; we want them *all* to thrive, with a life of happiness and prosperity. This databook draws attention to the dramatic inequality of circumstances that exist for our state's children, too many of our whom face seemingly insurmountable barriers to success.

2

At the Connecticut Association for Human Services, we do not want you to think of this publication as just a report, but rather as a tool to guide, direct and motivate policy leaders, advocates and the public to do what they can to improve the quality of life for Connecticut's children. This could mean volunteering as a mentor for a disadvantaged youth, or creating a child care center in the workplace, or passing legislation to enable all children living in poverty to attend Head Start programs. It means working with our friends, relatives and co-workers to ensure that elected representatives make tax and spending choices which will help poor children succeed. It means becoming actively involved in building a stronger Connecticut, one step at a time.

Conditions for children in Connecticut did not get worse overnight. The situation has been declining for ten, fifteen, twenty years and more. There will be no "silver bullet" that reverses this trend all at once, but the answer begins with the state as a whole.

Connecticut has the resources to do better than we have done. As the state with the greatest amount of resources in the country, we *can* do better. We should be setting the example for the rest of the nation to follow, showing others that a state which invests in its human infrastructure by helping children is securing its future prosperity.

Connecticut's Children: Increasingly Poor

Every Week in Connecticut

- 93 Babies are born with late or no prenatal care
- 29 Babies are born to mothers under age 18
- 66 Babies are born low birthweight
- 417 Children are victims of abuse or neglect
- 28 Children are arrested for violent crimes
- 138 Children are arrested for property crimes
- 64 Children are arrested for drug offenses
- 93 Children are placed in foster homes
- 103 High school students drop out of school
- 11 Children under age 20 die

Increasing Child Poverty: What does it mean for Connecticut's future?

One in five Connecticut children lives in poverty. In this special report, we look more closely at impoverished children, examine the causes of child poverty and its effects, and discuss what can be done to improve their lives and hence secure Connecticut's future.

The Numbers

Child poverty in Connecticut has increased almost 60% in the past decade from a rate of 12% of all children in 1985 to a rate of 19% of all children in 1995, according to the Annie E. Casey Foundation in its 1998 Kids Count Data Book released in May. This is by far the largest growth in the rate of child poverty of all fifty states. During the same time period, the national child poverty rate remained steady at 21%.

The picture is even more bleak when one looks at our youngest children. The National Center for Children in Poverty analyzed poverty focusing just on children under the age of six and found that one in four young children (23.96%) in our state lives below of the federal poverty

What is poverty?

Table 1. 1998 Federal Poverty Guidelines

Family Size	Monthly Income	Annual Income
1	\$671	\$8,050
2	\$904	\$10,850
3	\$1,138	\$13,650
4	\$1,371	\$16,450
5	\$1,604	\$19,250
6	\$1,837	\$22,050
for each add'l person, add	\$233	\$2,800

For these analyses, a family of four is considered to live in poverty if its income is less than \$16,450 a year. Considering that the cost of renting a two-bedroom apartment in the Hartford area is \$8,208 a year (\$684 per month), a family can barely afford to make ends meet without assistance of some kind (for example, reduced-price school lunches are available for children in families up to 185% of the federal poverty level which is \$30,432 for a family of 4).

level. This represents an increase in Connecticut's child poverty rate of 62% from the period of 1979-83 to the period of 1992-96, while the number of poor children increased from 30,440 to 67,250. This increase in poverty is quite startling when compared with the national rates which increased only 12%.

What this shows is that, while Connecticut had been a pretty exceptional place in which to live more than a decade ago, it has become "average" in terms of child poverty. We may be "average" now, but, if this trend continues, we will become much worse than average in the coming decade.

It is also important to examine the variations in child poverty within the state of Connecticut. For example, poor children are disproportionately concentrated in Connecticut's four largest cities — more than half of all

children receiving welfare benefits live in Hartford, New Haven, Bridgeport or Waterbury.

Table 2. Child Poverty in 1989 by Race and Ethnicity

Race or Ethnicity	Number	Percent
White	36,963	6.1
Black	23,591	28.9
American Indian, Eskimo or Aleut	313	21.4
Asian or Pacific Islander	917	6.6
Other	17,236	47.1
Hispanic*	30,002	41.2

Source: U.S. Census Bureau, 1990 Decennial Census

*As classified by the U.S. Census Bureau, persons of Hispanic ethnicity may be of any race

Connecticut children from minority groups are more likely to live in poverty as is seen in Table 2. Because data on the race and ethnicity of children living in poverty by state is only available from the decennial census, this table reflects 1989 family income.

Table 3. Child Poverty in Connecticut Counties, 1994

County	Number of Poor Children	Percent of all children
Fairfield	29,007	14.5
Hartford	42,079	20.7
Litchfield	3,536	8.0
Middlesex	2,861	8.4
New Haven	38,647	20.0
New London	8,927	14.0
Tolland	2,170	6.9
Windham	4,559	16.1
Connecticut	131,786	16.5

Source: U.S. Census Bureau data analyzed by the Applied Population Laboratory, Madison WI, 1998

As one would expect, there are dramatic differences in the poverty rates when looking at the county level. They range from a low of 6.9% in Tolland county, to a high of 20.7% in Hartford County (see Table 3). Ironically, Fairfield County, expected by many to have the lowest percentage of children in poverty, is fourth highest of the eight Connecticut counties.

Child Poverty Rates

The true scope of the problem is larger because all of these data show the numbers and percentages of children who were living in poverty at the point in time the data were collected. Many families move into and out of poverty each year. Nationally, and probably in Connecticut as well, one in three children spends at least one year in poverty before reaching adulthood. For

many, poverty lasts only a short while, but for more than 5% of children, poverty lasts 10 years or more. Families living with incomes close to the poverty line could experience a financial crisis should they encounter changes in employment, housing and utility costs, or life changes such as the birth of a child, changes in marital status, and illness or disability.

The Cause of Poverty

Children rely on their parents or caretakers for economic security. That is, children are poor because they live with poor adults. Any factor which reduces the likelihood of a parent or caretaker earning enough money to support his or her family thus contributes to childhood poverty. Many factors contribute to this complex problem, but four of the most important are single parenthood, low educational attainment, part-time or no employment, and low wages. Therefore, children are more likely to be poor if they depend on single mothers or on adults who are poorly educated, relatively young, minority or disabled. These children are also more likely to experience longer than-average poverty spells than children who do not live in such families.

Table 4. Number and percentage of poor children in the United States, and poverty rates of children under age six by age of mother at birth and family structure, 1996

Family structure and maternal age at birth	Poor children under age six		Poverty Rate Percent
	Number	Percent	
Children born to teenage mothers	888,745	16.2	47.1
Children born to adult mothers	4,602,943	83.8	21.1
Living with two parents	1,887,779	34.4	11.5
Living with father only	340,534	6.2	31.6
Living with mother only	3,082,262	56.1	54.8
Living with neither parent	181,113	3.3	33.1

Source: National Center for Children in Poverty, 1998

As one can clearly see from Table 4, the majority of poor young children live with only their mothers. But having two parents is no insurance against poverty; more than one-third of all poor young children live with married parents. Similarly, young children with well-educated parents are much less likely to be poor, but high-school graduation is not enough to insure against poverty, even though more educated parents are more likely to be employed full-time.

More than three-fifths of poor young children live in families in which at least one parent is employed, and one parent's full-time employment is no guarantee against poverty. There is growing concern that while work appears to be the logical remedy to prevent poverty, work at low wages is ineffective when it comes to lifting families out of poverty.

Each of these variables — single parenthood, low educational attainment, part-time or no employment and low wages — when taken alone, raises the risk of being poor. Unfortunately many families with children experience more than one of these risk factors, and the cumulative effects can be economically devastating.

The Effects of Child Poverty

The cost of child poverty is enormous, both for the children themselves and for society. Poverty is related to, or associated with, almost every other problem that confronts children. Children in poverty are more likely to be sick than middle-class and upper-class children. They are more likely to live in substandard housing, be hungry, or be victims of neighborhood violence. They also have a greater exposure to substance use and abuse, are more likely to live in non-intact families, and are more likely to have inadequate day care. These youngsters also have reduced access to transportation and communication devices, and reduced access to quality education.

In addition, as we wrote about extensively in last year's *Connecticut's Children* book, research shows that poverty during the first years of life poses serious threats to brain development. Poor infants and toddlers face a greater risk of impaired brain development due to their exposure to a number of risk factors associated with poverty. These risks include inadequate nutrition, substance abuse, exposure to environmental toxins, maternal depression, trauma/abuse, and lack of quality child care. The first years of a child's life are crucial to his or her emotional and intellectual development. Many poor children are resilient and able to overcome

tremendous obstacles, but the early years are a sensitive period when the brain is most able to respond and grow from exposure to environmental stimulation. While all children are potentially vulnerable to a number of risk factors which can impede brain development during this sensitive time, a disproportionate number of children in poverty are actually exposed to these risks.

Children who do not receive proper nutrition during their early, formative years test worse than well-nourished children in vocabulary, reading comprehension, arithmetic and general knowledge. The developmental delays caused by malnutrition are serious, and the poorer the child's family, the more severe the malnutrition is likely to be.

The negative effect of parental use of nicotine, alcohol and drugs on children is well documented. Research has demonstrated that parental substance abuse leads to poor brain development in children, and that poorer children are more likely to be subject to these substances. Similarly, poorer children are more likely to be exposed to environmental toxins such as lead which causes brain damage and stunts the growth of the brain.

The stressors facing poor families also cause a great deal of trauma for their children. Experiences of trauma

or abuse when a child is young lead to extreme anxiety and depression, and often hinder the children's ability to form healthy attachments to others. People who were traumatized as young children are also more likely to act out violently later in life.

Not only are negative interactions with others bad for children, but the lack of consistent positive interaction is also harmful. To ensure healthy emotional and mental development, young children need to have daily interactions with caring adults who provide appropriate stimulation. Poor quality child care is a part of the lives of many impoverished children and can impede their proper brain development during this formative time. This is especially true for low-income children who are more likely to have working parents.

The Causes for the Increase in Child Poverty since 1985

The increase in childhood poverty in Connecticut during the past decade defies simple explanation. The increase took place at a time when the economy was improving. Unemployment rates in Connecticut were decreasing. Other states in our region of the country—including Rhode Island, Vermont, Massachusetts, and New

Hampshire—were experiencing either significant reductions in childhood poverty (in the under-six group) or much more modest increases. Finally, Connecticut's increase in child poverty took place at a time when other indicators of child well-being, including high school dropout rates and percentage of teens either working or attending school, were among the best in the nation.

What factors, therefore, may be contributing to this increase in poverty? The percentage of children living with single parents and the percentage of teen births both increased during this ten year time period. And, most significantly, full-time employment rates for parents of young children in Connecticut declined by 13% during the period, according to the National Center for Children in Poverty.

Another factor relates to the structure of Connecticut's job market. During the last fifteen years, the state lost manufacturing jobs that paid relatively high wages and gained service sector jobs with lower wages and fewer benefits. In addition, employers report that a gap exists between worker skills and the skills needed for available jobs. Especially at a time with low levels of unemployment, companies have difficulty filling job openings because of a lack of qualified applicants.

Table 5. Monthly Income Under Temporary Assistance to Needy Families (TANF)

Hourly Wage	Total Income	Earnings	TANF Benefit	Food Stamps Benefits	FICA Tax	Federal Tax	EITC
\$5.18	\$1,600	\$891	\$464	\$8	(\$68)	\$0	\$305
\$5.50	\$1,643	\$946	\$464	\$0	(\$72)	\$0	\$30

What About Welfare Reform?

Much media attention has been paid to the "success" of welfare reform in our state. But success depends upon how one measures it. One of the major goals of welfare reform was to increase the number of welfare recipients who work, and to decrease the number who receive state assistance. Although our state is meeting this goal with the help of a booming economy, it is still failing on a more important measure: these families are still living in poverty. This is because there are just not enough jobs that pay living wages for people with the skills of most welfare recipients. Additionally, many workers are only able to find part-time work.

Moving welfare recipients off of welfare and into work does not usually move them out of poverty. As of September 1998, these families earned a monthly average of \$694, not enough to rise above poverty and far from what one could call secure self-sufficiency. A single mother with two children would have to earn \$909 month (\$5.20 an hour for 40 hours a week), collect food stamps and receive the federal Earned Income Tax Credit (EITC) to reach the

federal poverty level without Temporary Assistance to Needy Families (TANF) welfare benefits (see Table 5). However, only 20% of these welfare recipients are working more than 35 hours per week, so their monthly income might not be sufficient even with higher paying jobs.

In addition, Connecticut's twenty-one month cut-off for benefits is one of the strictest time limits in the nation. Its effect is somewhat muted right now by a strong economy, but many poor parents may lose their jobs during the next downturn in the economic cycle. If they reach their time limit, current law provides no avenue for government assistance. This would result in an even higher rate of child poverty.

Prior to the twenty-one month benefit limit, Connecticut's welfare recipients are allowed to keep all of their earnings until their income reaches the poverty level. The formula, however, creates an "income cliff" when the family earns any more than \$6.45 an hour (assuming 40 hours per week) which is not made up for until the worker earns \$11.00 an hour (see Chart 1). There is a similar dramatic drop in income when the family reaches the end of its twenty-one months.

Another very difficult time for many poor children will

come two years after their parents have left the welfare rolls. That is when Medicaid coverage, daycare and transportation assistance are cut off. Because many of these parents will not be in jobs which provide such benefits, the cost of being at work will increase dramatically for these families.

So far, this analysis has assumed that the federal poverty level is an adequate amount of income for a family to live on. However, this is a topic of great debate. The current federal poverty level was established in the 1960s and, although adjusted annually for inflation,

is based on a set of assumptions that are no longer true (for example, there have been large increases in family expenses for child care, housing and medical care since the 1960s).

So what do Americans think the poverty level should be? The Gallup Poll regularly asks Americans what they think is the least amount of money required to live adequately; respondents consistently cite an amount that is more than 150% of the official federal poverty level.

Another problem with the federal

Chart 1. Monthly Income for TANF recipients
(figures based on a mother and two children)

poverty level is that it is the same throughout the nation. It does not reflect variations in the cost of living, especially in the cost of housing. Given that the cost of living in Connecticut is substantially higher than in other regions of the U.S., the federal poverty level undercounts the number of people in Connecticut *whose incomes are inadequate to meet the basic necessities of life.*

Federal and state policies already acknowledge that people living above the federal poverty level still need assistance to pay for basic necessities. For example, reduced-price school lunches are offered to children whose families earn less than 185% of poverty, and Medicaid provides health coverage for these same children.

Table 6 shows the difference between the number of children receiving welfare benefits and the number of children receiving free or reduced-price meals. On a statewide basis, the number of

Table 6. Children receiving welfare benefits, June 30, 1997 and children eligible to receive free or reduced-price meals (1997-98 school year).

The Cure for Child Poverty

What policies and practices are needed in Connecticut to address the problem of poverty? We at CAHS believe that one place to start is to ensure that workers are paid a living wage for their work. The best antidote to child poverty is employment that provides parents with adequate wages to support their families.

One place to begin to look for solutions is to other countries. Every other major Western industrialized nation has been more successful in preventing child poverty thereby decreasing the risks to healthy brain development. The U.S. can learn from these countries and develop new public and private sector strategies that are consistent with its national values and economic means in order to help children.

Family support assistance in the U.S., unlike that in many other countries, does not lift all families above the poverty level. Overall U.S. spending on social programs for children declined through the 1980s and early 1990s while child poverty deepened. Non-cash benefits, such as medical and child care services which are universally available in many European countries, would be extremely helpful to Connecticut families.

Another program which can be extremely helpful to impoverished families is housing assistance (such as Section 8 vouchers). For the 20% of poor families who receive this benefit, it often makes all the difference between making ends meet and living without basic necessities. This program could be expanded to include the other 80% of impoverished families who do not currently receive this help.

While unemployment rates in Connecticut and the nation have dipped to record lows, the real value of the median wage for Connecticut workers has declined steadily over the past two decades. Increases in the state minimum wage which will go into effect in 1999 and 2000 will help many poor families as long as they are able to find jobs that allow them to work forty hours each week.

Other state and local government policies, such as requiring government contractors to pay their employees a living wage, can meet with great success in lifting some families out of poverty. New Haven has piloted such an approach, and it will be interesting to study its impact over time.

A more comprehensive approach calls for state or local living wage laws that apply to all wage earners in a geographic area. Assuring a liveable minimum wage in this manner lifts more families out of poverty and simultaneously helps stimulate the economy as families enjoy increased purchasing power.

More widespread support can be offered by changes in tax policy. By offsetting taxes and providing wage supplements, recent research finds that the federal Earned Income Tax Credit (EITC) has helped keep single mothers in the labor force over the past twelve years, and has moderated widening gaps between the wealthy and the working poor. Based on these positive results, many states are extending similar state tax credits to low-income families. Connecticut could use this tool both to encourage adults to work and to lift more children out of poverty.

One last area addresses the issue of family structure. While child support is designed to bolster the economic

15

security of eligible children, collection of these funds is difficult at best. In Connecticut only one in three female-headed families received child support or alimony in 1995. Improved enforcement efforts could help to increase this collection rate, and help children escape poverty.

These are just a few suggestions to counter child poverty in Connecticut. Implementing any one or all of them could help secure Connecticut's future for all its citizens.

Children Receiving Welfare Benefits

Note: The numbers shown here are the total number of children receiving benefits on June 30th of that year. It is a snapshot in time and does not represent the total number of children who received benefits at any time during that year. The rate is calculated by dividing the number of children receiving benefits by the total number of children in that region. The total number of children used to calculate the rates is based on applying the percentage of population under 18 for each region from the 1990 Census to the Connecticut Department of Health estimate of population by town for the years 1996 and 1997. Beginning in 1997, the Aid to Families with Dependent Children (AFDC) program changed to become the Temporary Family Assistance program, with different program benefits and rules (except in two towns in which AFDC benefits remain the same and act as a control group.) Therefore the change in the number of children receiving welfare benefits is in part due to the change in program.

Children Receiving Free or Reduced-Price School Meals

28

Note: Schools report to the State Department of Education the number of children who are eligible for free and reduce-price meals, although because this is a voluntary program, schools are unable to count children from families who do not apply for this program but who would be eligible. Schools that do not offer school meals may report instead the number of children eligible for welfare benefits. Income guidelines for this program are 130% of the federal poverty level (FPL) for free lunches and 185% of the FPL for reduced-price meals. Charter and magnet schools by their very nature draw students from across regional boundaries, but because the data was so striking it has been included as a separate row on this table.

ERRATA

page 29 -- The data shown in the "Children Receiving Free or Reduced-Price School Meals" table is from 1997-98 school year, not 1996-97.

page 52 -- In the "Teen Deaths" table, the first line of data should be labeled 1992, not 1991.

Births to Teenage Mothers

Note: The number of teen births shown here is the total number of babies born to mothers age 19 or younger. The rate is the total number of teen births divided by the total number of births, then multiplied by 100 to get a percentage. The percentage shown here measures the risks to the generation of babies being born today. The teen birth rate, which compares the number of teen births to the number of teenage girls, is not available at a local level. This is because of a lack of reliable data for the number of teenage girls to use as a denominator and estimates could not be made because of the narrow age range. The state-wide teen birth rate of 39 births per 1000 girls is based on the number of girls ages 15-19.

Child Deaths

Note: The annual average number of child deaths shown here is the total number of deaths to children ages 1 to 14 over a three year period, divided by three. The annual average rate is the total number of child deaths over three years, divided by three, divided by the total number of children ages 1-14 in 1996, then multiplied by 100,000 to get a rate per 100,000 children in that age group. The number of children used to calculate the rates is based on applying the percentage of population ages 1-14 for each region from the 1990 Census to the Connecticut Department of Health estimate of population by town for 1996.

Connecticut Mastery Test — Above Goal

Note: The State Department of Education tests sixth grade students on their reading, writing, and mathematical skills. The state goal is the level that ideally every student at that grade level is expected to achieve. The rates are calculated by dividing the number of students who scored at or above goal on all three tests by the total number of students. This data is not included on the regional pages.

Connecticut Academic Performance Test — At or Above State Goal

Note: The State Department of Education tests tenth grade students in four areas: language arts, mathematics, science and an interdisciplinary task. The rates are calculated by dividing the number of students who scored at or above goal on all four tests by the total number of students.

High School Dropouts

Note: Dropout rates used here are only for high school students and only include the number of youths who dropped out of school in the given year. They do not include the number of children who drop out of school before ninth grade. The dropout figures calculated by the State Department of Education include students who officially withdraw from school, those who enter a non-educational program (e.g. truck driving school or GED classes), and those whose status is unknown. Students transferring to another school are not counted as dropouts. These figures do not include the one percent of students who are enrolled in ungraded classes.

Juvenile Violent Crime Arrests

Note: Violent crimes include murder, rape, robbery and aggravated assault. Because of the large difference in the number of arrests each year, three year averages are shown. The annual average number of arrests is a total for the three year period divided by three. The annual average rate is the annual average number divided by the number of children age 10-17, multiplied by 100,000 to get a rate per 100,000 children of this age group. The number of children used to calculate the rates is based on applying the percentage of population age 10-17 for each region from the 1990 Census to the Connecticut Department of Health estimate of population by town for the years 1993 and 1996. The number of arrests of children for violent crimes includes arrests made by local and state police. Unfortunately, the data is not reported identically for these agencies. Approximately 85% of all juvenile arrests for violent crimes are made by local police, and this data is reported by the town in which the arrest was made. The 15% of arrests made by the state police are reported by the town in which the child lives. State police arrests are important to include because many rural regions do not have municipal police departments, and the majority of the arrests in these regions are made by the state police. Therefore, one should exercise caution when using this data because the total number of juvenile arrests for each region includes data from these two sources. Despite these limitations, given the limited mobility of children ages 10-17, police experts believe that this data is still valid.

Child Abuse

Note: The rate is the total number of children who have been confirmed by the Department of Children and Families as neglected or abused between July 1, 1996 and June 30, 1997, divided by the total number of children ages 1-18 in 1996, then multiplied by 100 to get a percentage. The number of children used to calculate the rates is based on applying the percentage of population under 18 for each region from the 1990 Census to the Connecticut Department of Health estimate of population by town for 1996. Improved data collection by the Department of Children and Families during this time period does not allow for comparisons to previous years' data.

Teen Deaths

The vast majority of teen deaths are caused by injury rather than disease. For teens age 15-19, unintentional injuries caused one-third of all deaths in 1996. In most regions of the state, these injuries are unintentional; they are mostly due to car crashes, the leading cause of death. This is not true, however, in Connecticut's three largest cities, where teen homicides are more than twice as likely as deaths from unintentional injuries.

The risk of injury-related deaths increases with age — teens ages 15-19 are more likely to die of injuries than are children ages 1-14. Also, teen injury deaths are much more likely to be to teen boys than teen girls.

Homicide and suicide are the second and third single leading causes of death for 15 to 19 year olds in our state. In 1996, 28 teenagers were homicide victims, accounting for one-fourth of all deaths for this age group.

Teen Deaths (ages 15-19)

	Unint'l Injury	Homicide	Suicide	Other	Total
1991	47	33	12	24	116
1993	52	34	14	38	138
1994	55	40	19	29	143
1995	57	24	11	33	125
1996	40	28	12	34	114
Total	251	159	68	158	636

Young males are more likely to be victims of homicide than females. Girls are more likely to attempt suicide than boys, but boys are more likely to be successful in their suicide attempts.

Note: Because of the small number of teen deaths in any given year, the chart shows only five-year total numbers of deaths by cause, not an annual average as in the other charts. For the same reason, rates could not be calculated by region, and therefore this data is not shown on the regional pages.

Terms

Children:

Throughout this book, we have used the term "children" to apply to persons younger than the age of 18. Where the available data uses a different age grouping, it is so noted.

Race/ethnicity:

We have reported race and ethnicity using the categories established for the 1990 U.S. Census and used by state agencies providing the data. People of Hispanic origin may be of any race.

Fiscal year data:

Most data presented here is for calendar years. Where data collected by state or federal authorities was available only by fiscal years, it is noted as SFY (state fiscal year, July 1 to June 30) or FFY (federal fiscal year, October 1 to September 30).

Methodology

83

Number:

For each indicator, we include the number of "events" for a given time period, for example, the number of high school students who dropped out during the 1996-97 school year.

Rate:

For 14 of the 15 child well-being indicators, we include rates as well as numbers. A rate is a measure of the likelihood of an event, and is calculated by dividing the number of events by the number of persons that are "eligible" for that event. For example, the high school dropout rate is the number of students who dropped out in a given year by the number of students enrolled. A percentage is a rate per 100. Other rates included here are per 1,000 or 100,000. Rates can be used to compare between regions for a specific indicator. Rates were not calculated if the number of "events" was less than 5. The regions with rates worse than the statewide rate are highlighted on each table. Meaningful rates can not be calculated for the teen deaths measure at the local level because of a lack of reliable data for the number of teenagers to use as a denominator and estimates could not be made because of the narrow age range.

Rounding:

In the charts, all rates are calculated to the nearest tenth of a percent. The percent change in rates over time are rounded to the nearest whole number. (Please note that because of this rounding, percentages may not always add up to exactly one hundred percent.)

Sources:

Data sources are listed on each page in the Child Well-Being Indicators section starting on page 17.

Notes:

We have included technical information from the text as necessary as notes at the bottom of the page referenced. The formula used for calculating the data in the charts, and any limitations of the data, are included there as well.

Selection of indicators:

Many different indicators could have been used to measure the well-being of children. The compilation of these indicators for our first book was a function of 1) the results of a survey of members of the Children's Future Panel (a group of more than forty individuals who are advising this project), 2) relation to national KIDS COUNT indicators, 3) how directly the indicator measured children's well-being, and 4) availability of data.

Regions:

For the purposes of this report, we have divided Connecticut into 27 regions (towns or groups of towns) based on the public use microdata areas established by the Census Bureau. The use of regions allowed us to calculate rates where the population would have been too small at the town level. Each region has a population of more than 100,000, and no town is split between two regions. The five largest cities, Bridgeport, Hartford, New Haven, Stamford, and Waterbury, are regions unto themselves. The raw data for the tables was collected originally for each town, and then towns were grouped into regions. Regional school districts sometimes enrolled students from more than one of the regions for the high school dropout data used in this report; a list of the regions to which these school districts were assigned can be found on page 21. Indexes to towns and regions and a map are located on pages 18-20.

Comparing regions to state-wide rate:

On the regional tables, the rate for each indicator is shown as a percent better or worse than the state-wide rate. Because this percentage varies on the measure, one should look at the child well-being indicator tables to see how your region compared to others on that measure. For example, a region could have a high school dropout rate that is twice the statewide rate.

Comparing regions to one another:

This report makes no attempt to combine indicators into an overall score for any region. Given the diversity of the indicators and their measurement, and the wide diversity of demographics across regions, we felt it best to view the indicators individually and form a more holistic view of how well children in each region were doing.
